

AMPHISOL® K

K-ELEMENT
Ultimate stability for
multi formulations

NUTRITION • HEALTH • SUSTAINABLE LIVING

DSM

BRIGHT SCIENCE. BRIGHTER LIVING.

Introduction

Multiple textures, multifunctional products, and consumers increasingly in search of unique and innovative experiences. In a world where people increasingly value experiences through the products they consume, the variety of cosmetic formulations grows.

Creams, sprays, mousses, to name a few, with a considerable quantity of pigments and skin actives like make-up and products with high SPF bring a series of technical challenges, especially when it comes to stabilization. So, how to achieve completely stable formulations in less time? DSM, a pioneer in potassium cetyl phosphate technology, presents a definitive emulsifying solution: AMPHISOL® K, a high-performing Potassium Cetyl Phosphate emulsifier for the most challenging formulations. A unique solution for the creation of innovative textures and applications which place you and your company in a leading position in an increasingly competitive market.

Key facts

THE PRODUCT

- INCI name: Potassium Cetyl Phosphate
- Anionic oil-in-water emulsifier
- Theoretical HLB value: 9.6

BENEFITS

- A high performing emulsifier for the most challenging formulations with proven performance vs main benchmarks.
- Unique microdomains technology capable of stabilizing the most versatile combination of ingredients with high amounts of pigments, electrolytes, ethanol and oil from sunscreens to skin care and make-up.
- At 0.5% can also be used as a co-emulsifier to rescue and beautify your formulations, making processing easier.
- AMPHISOL® K brings additional benefits to your products such as improved moisturization, SPF boosting and remarkable sensory signature.

COSMETIC APPLICATION

- Sun and skin care
- Color cosmetics such as mascaras or foundations
- Hair care and cleansing products

SUGGESTED CONCENTRATION

- 1-2% as primary emulsifier
- 0.5% as secondary emulsifier

DSM has, for the first time, visualized the mechanism of action of AMPHISOL® K.

The science

Presence of liquid crystalline structures

AMPHISOL® K forms both lamellar and vesicular liquid crystalline structures

A stable O/W emulsion consists of an aqueous bulk phase, a dispersed liquid oil phase and a liquid crystalline gel-network structure. The liquid crystalline gel network can form vesicular structures that stabilize oil droplets and lamellar structures (membrane-like structures found throughout the aqueous phase).

Recent research using freeze-fracture Transmission Electronic Microscopy has shown that AMPHISOL® K is able to form both lamellar and vesicular liquid crystalline structures (Figure 1) where other emulsifiers form predominantly lamellar structures.

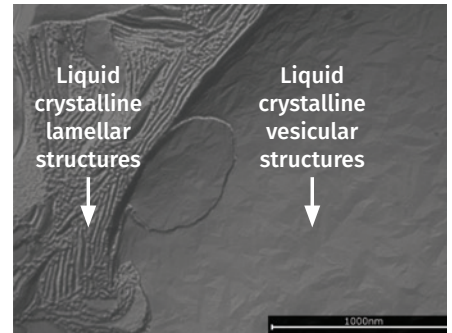

Figure 1: Liquid crystalline structures visualized by freeze-fracture Transmission Electronic Microscopy

Presence of microdomains

Unique appearance of microdomains, particularly on vesicular structures, is responsible for ultimate stability

The theory behind microdomains is they're self-organized AMPHISOL® K molecules (Figure 2) resulting in a negative charge area produced by polar head groups.

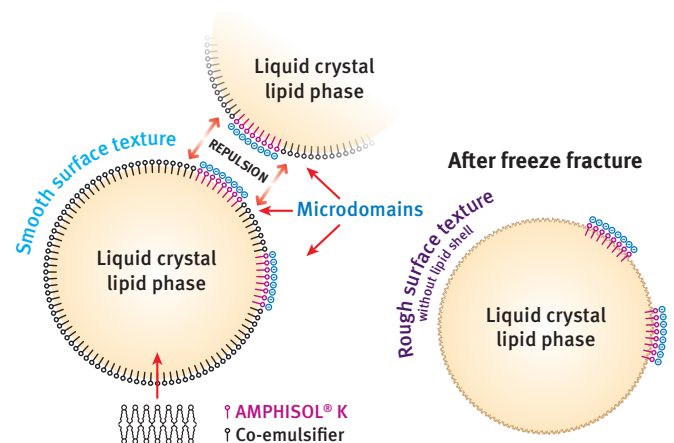

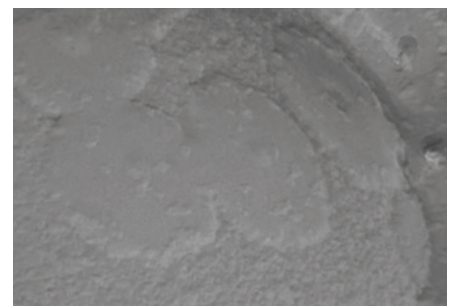

Figure 2: Graphic representation and freeze-fracture Transmission Electronic Microscopy picture of AMPHISOL® K

This charge distribution leads to mutual repulsion of the vesicles which prevents their coalescence and is one of the main reasons for the optimal stabilization achieved with AMPHISOL® K.

The performance

Save time

- Strongly compatible with high oil concentrations
- Highly suitable for high pigment load

BB and CC creams, as well as sunscreens, often contain pigments like TiO₂ or ZnO, which can, depending on the coating, lead to significant viscosity and stability changes. Just 1% AMPHISOL® K can stabilize emulsions containing up to 7% PARSOL® TX (TiO₂) (Figure 3) where other emulsifiers fail or require double concentration to reach the same result.

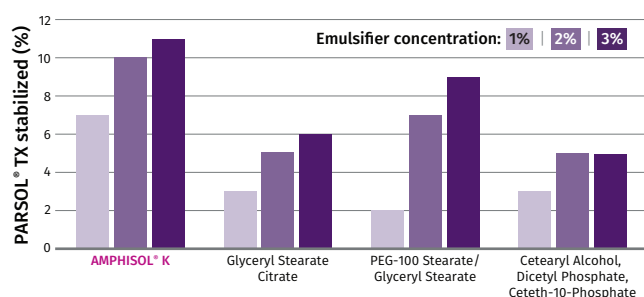

Figure 3: Stable emulsions with AMPHISOL® K and PARSOL® TX

- Highly compatible with electrolytes
- Excellent compatibility with ethanol

The current focus on the sensory profile of formulations means that ingredients such as ethanol are often used to achieve a light, refreshing skin feel. But this can be a cause of instability. A 1% AMPHISOL® K formulation is capable of stabilizing emulsions containing up to 10% ethanol (Figure 4) where other emulsifiers fail.

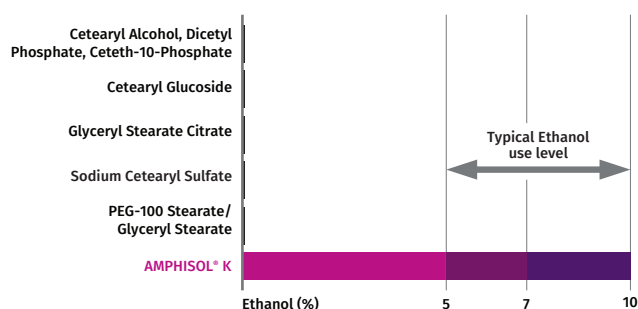

Figure 4: Stable emulsions with AMPHISOL® K and ethanol

Save money

Simplify emulsion systems

Many market products use a complex system of various emulsifiers and co-emulsifiers. Adding and handling more ingredients in production add extra costs. Using just AMPHISOL® K plus a co-emulsifier make emulsions more cost efficient.

Easy to formulate several viscosities

With AMPHISOL® K, you only need one emulsifier to formulate a range of products with different viscosities – from sprays to thick creams (Figure 5). Or, if you are using a different emulsifier system, adding 0.5% AMPHISOL® K can reduce viscosity to produce sprayable formulations while maintaining stability.

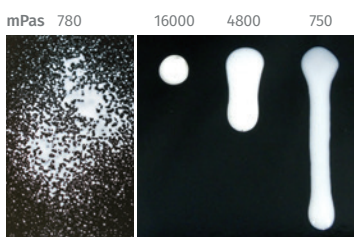

Figure 5: Viscosities with AMPHISOL® K emulsions

Additional benefits: SPF booster, moisturizer, sensory signature

Achieving a high SPF can be challenging and takes development time. AMPHISOL® K helps boost your formulation and reach the next SPF level by improved emulsification process (Figure 6). It also brings additional moisturizing properties thanks to the proven liquid crystals structure.

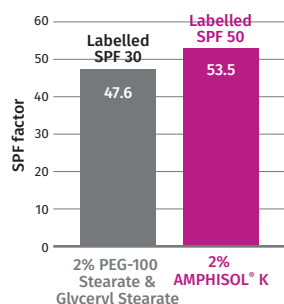

Figure 6: AMPHISOL® K upgrades the SPF to reach the next protection level

Rescue instable formulations

If you have an unstable formulation, just add 0.5% AMPHISOL® K to stabilize your emulsion until the last drop.

Formulation guidelines

- AMPHISOL® K needs to be dispersed under stirring at the following temperatures: 80–85°C in water phase, 85–90°C in oil phase (min 60°C when used as a co-emulsifier).
- It doesn't dissolve completely in the heated oil or water phase.
- Despite not completely dissolving in either phase, AMPHISOL® K will be oriented to form, during the emulsification, liquid crystalline structures around the oil phase and at the oil/water interphase droplets in the first 24 hours.
- After combining both phases we recommend a homogenization step and a second shorter one below 40°C.
- Below 40°C add neutralizing agents and temperature sensitive agent.
- AMPHISOL® K is not sensitive to shear forces and doesn't need strong shearing. But adapt shear force accordingly to production scale and shearing equipment.
- Stir while cooling down further.
- The formulations need 24–48h for ripening and to adjust themselves to the final viscosity.
- AMPHISOL® K forms stable emulsion in a pH range from 5 to 8.

K-ELEMENT: Stabilized formula by AMPHISOL® K

A line of bespoke on-trend formulations featuring multiple textures and applications. All use AMPHISOL® K to maximize balance and stability between ingredients, ensuring top performance to the very last drop of the product.
